Energy trilemma

SAV₉

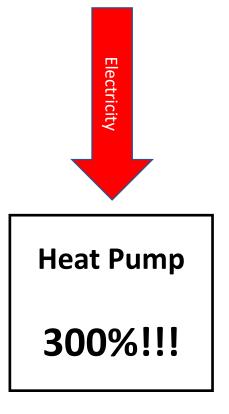

SAV₉ Design choices – 150 apartments

SAV₉

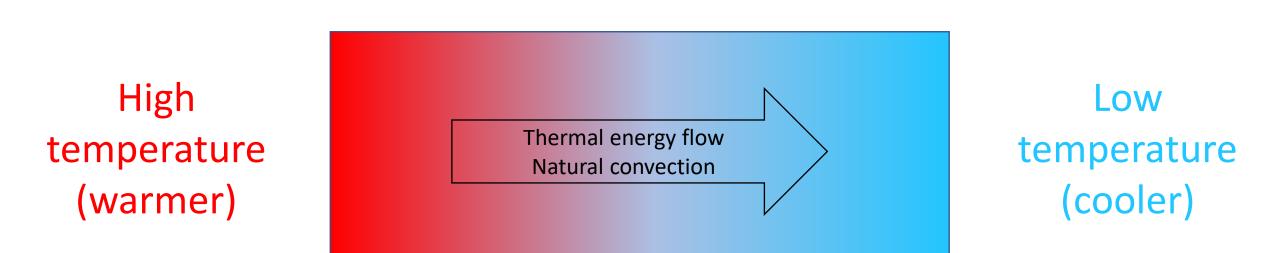

Temperature difference is a must for heat transfer

7°C outdoor temperature

Heat transfer

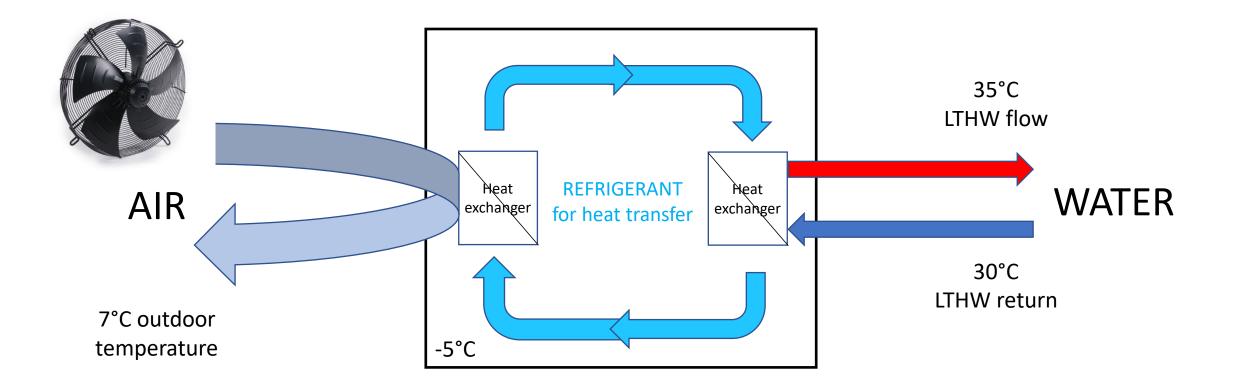

SAV.

How do we move heat from a cooler area to a warmer area?

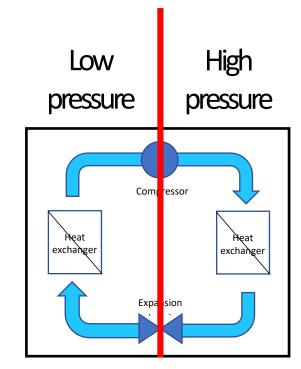

REFRIGERANT transfers heat

Example: refrigerant R407C approximate temperatures Boilingpoint-44°Catatmosphericpressure

Compressor - pressurizes and circulates refrigerant

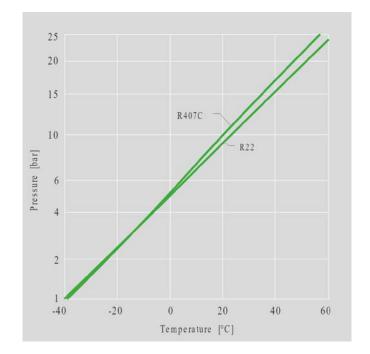

- compressor increases the pressure of a gas
- compressor is <u>similar to pump</u>:
 - \checkmark increase the pressure on a fluid
 - ✓ can transport the fluid through a pipe

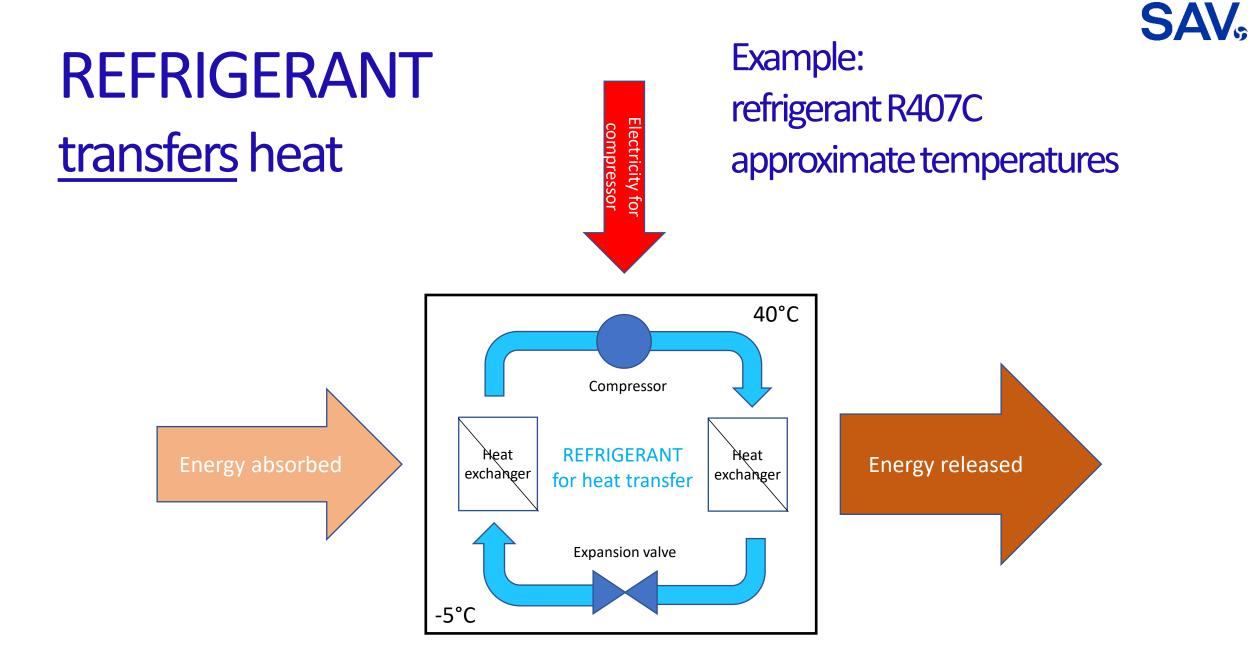

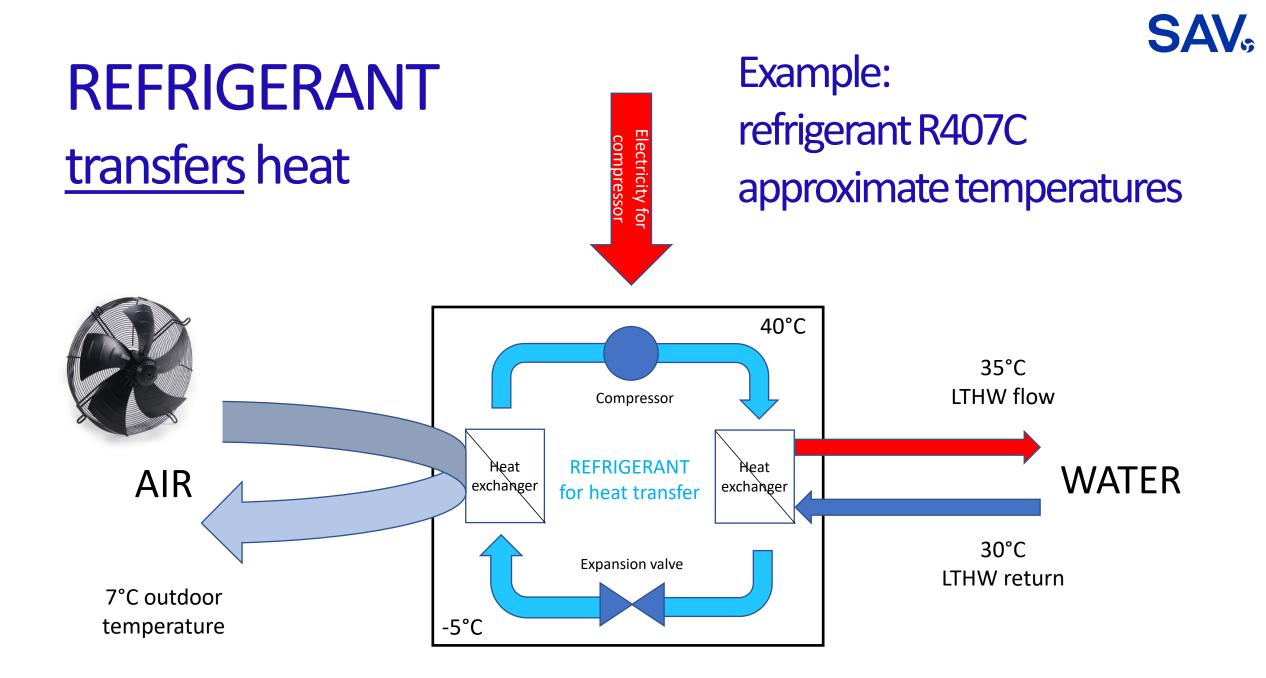

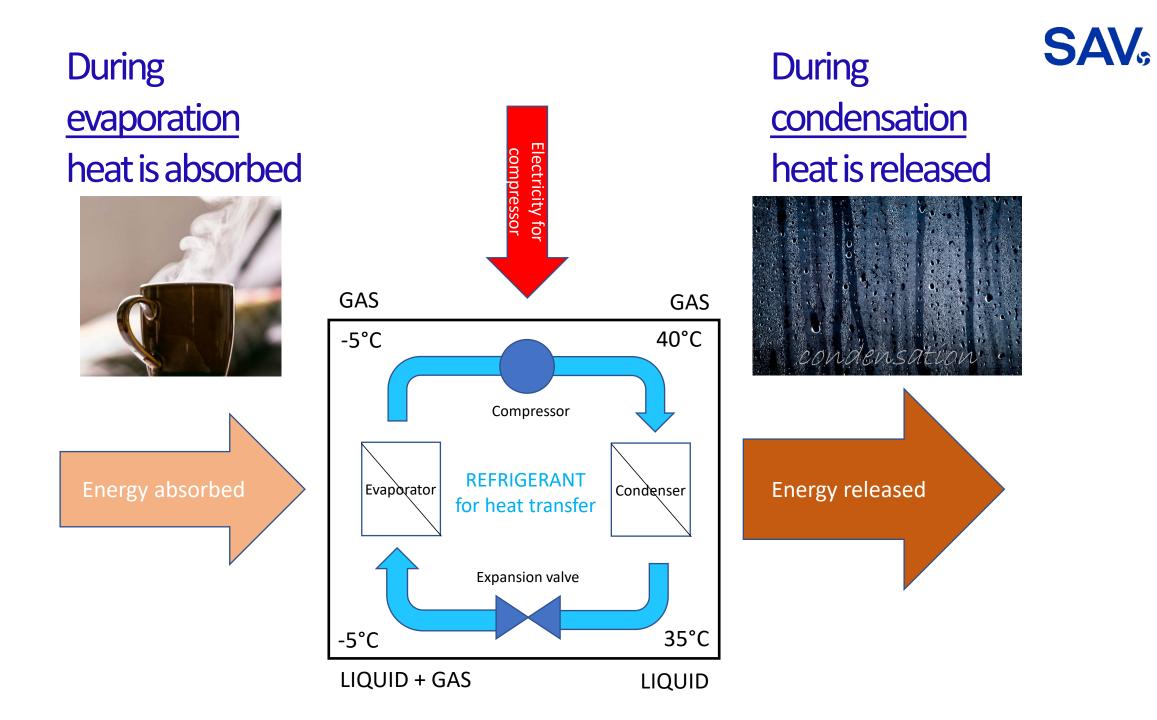

Heat pump relies on refrigerant pressure / temperature relationship

- temperature and pressure of a gas are proportionally related at a constant volume
- pressure is increased temperature rises

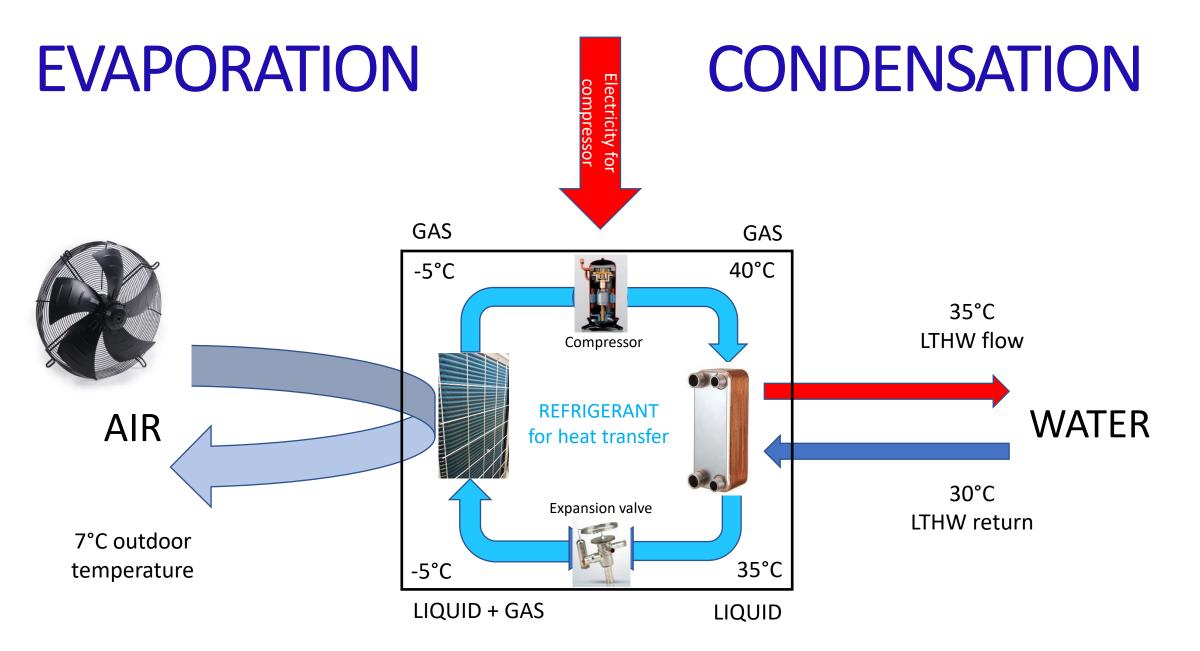

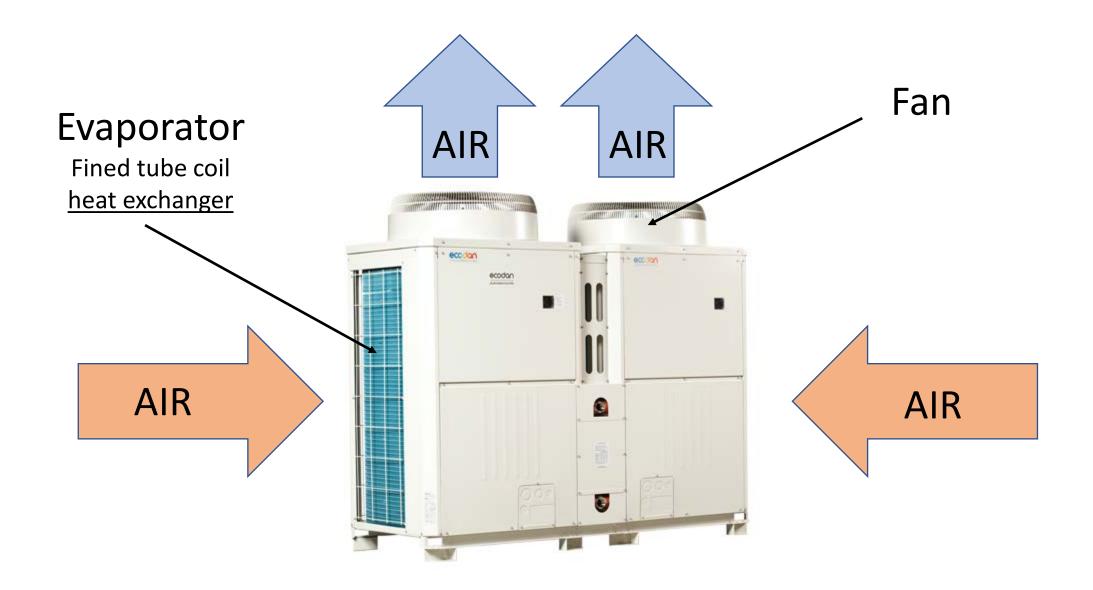

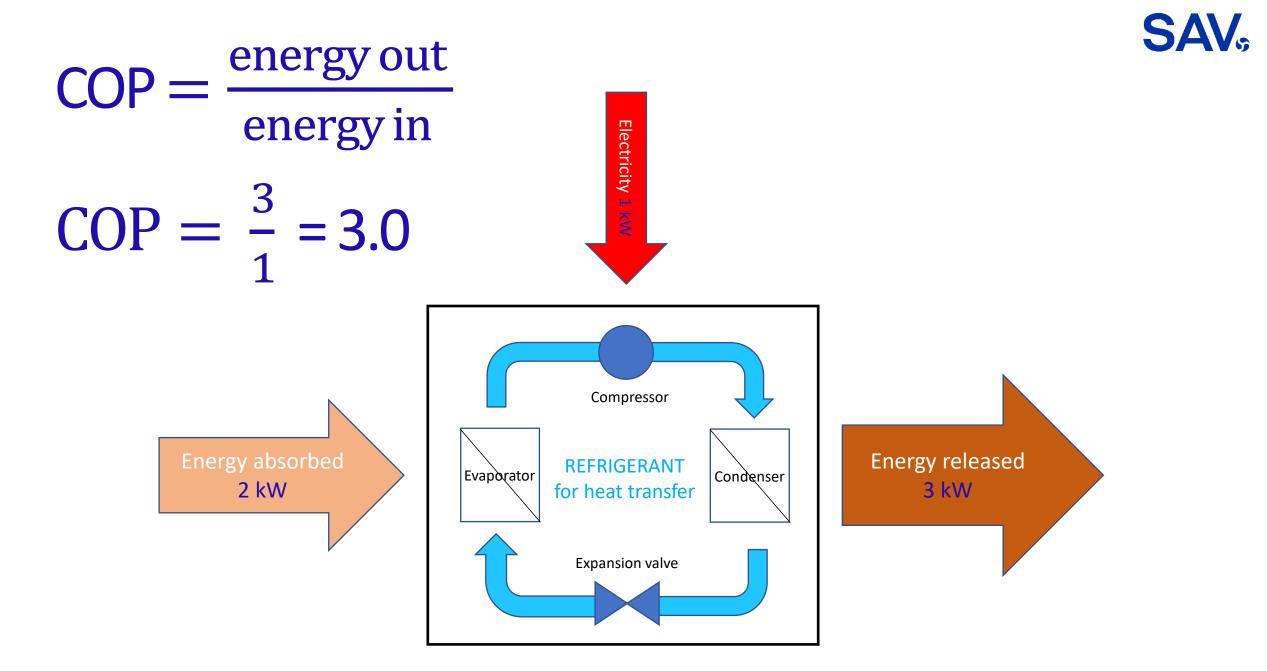

SAV₉

Airflow: 22,000 m³/h

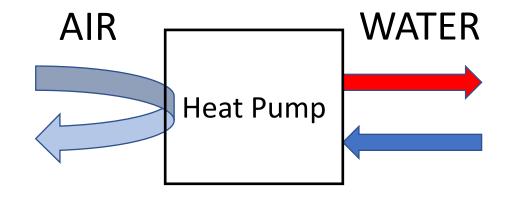

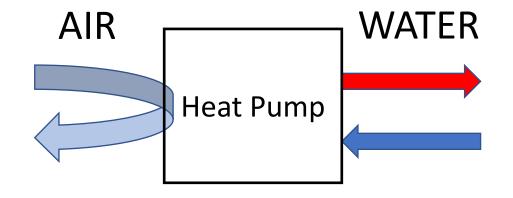

COP – outdoor temperature

Outdoor temp.	СОР	HP operating temp.
10°C	4.58	30/35°C
5°C	3.63	30/35°C
0°C	2.90	30/35°C

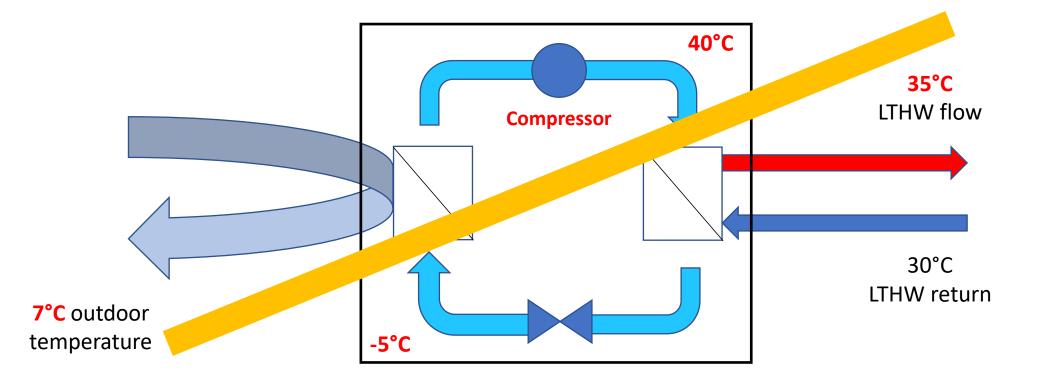

COP – operating temperatures

Outdoor temp.	СОР	HP operating temp.
5°C	3.63	30/35°C
5°C	3.06	40/45°C
5°C	2.49	50/55°C

COP – temperature gap to bridge

COP decreases with increasing temperature difference

Monetising return temperatures

43 kW HP

Outdoor	HP operating	СОР	Power input	Energ	gy cost	Emissions		
temp.	temp.			£/h	£/year	kg CO ₂ /h	kg CO ₂ /year	
5°C	30/35°C	3.63	12 kW	1.6	6,400	6.2	24,800	
5°C	40/45°C	3.06	14.2 kW	1.9	7,600	7.4	29,600	
5°C	50/55°C	2.49	17.5 kW	2.3	9,200	9.1	36,400	

- Electricity price 13.19 p/kWh
- Electricity CO₂ 0.519 kg/kWh
- 4,000 operating hours per year

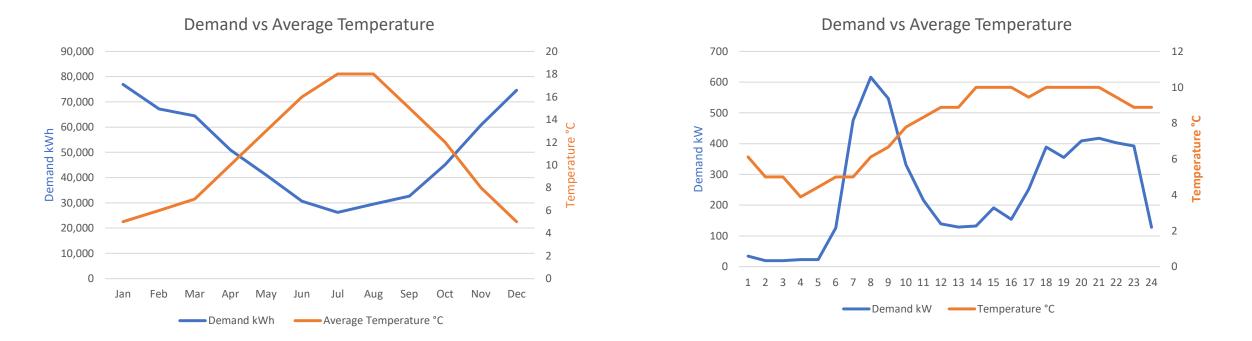

COP – snapshot efficiency SCOP – seasonal COP

SCOP

- HP's average annual efficiency performance
- should be used in project assessment
- datasheet SCOP is based on 4,910 heating hours in Strasbourg
- ideally weather data from a project location should be used

SCOP – seasonal COP

- seasonal temperatures and demand weighted
- should be at least 2.8

Sizing – loads & diversity

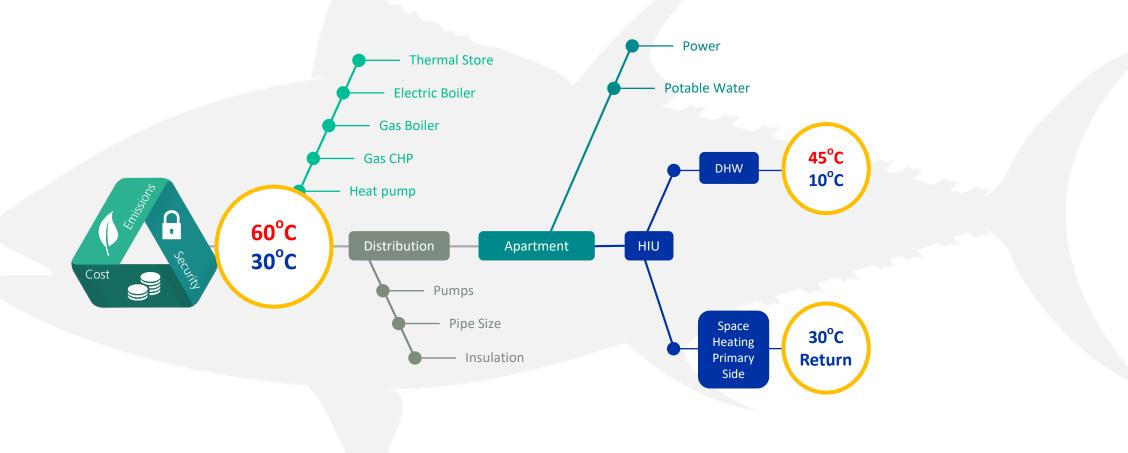

150 two bedroom apartments	60/30
DHW load	35 kW
Heating load	2 kW
DHW diversity factor	0.0756
Heating diversity factor	0.6225
Peak plant without buffer	584 kW
Peak plant with buffer	256 kW
DHW buffer volume	2,000 l
DHW peak flow rate	2.2 l/s
Heating peak flow rate	1.6 l/s
Total peak flow rate	3.8 l/s
Plantroom pipe size	65 mm

Design temperate	ures	DHW	Heating
Heat Network	Supply	60°C	60°C
(Primary)	Return	17°C	32°C
Apartment	Supply	45°C	50°C
(Secondary)	Return	10°C	30°C

SAV.

Heat Network - Fishbone Diagram SAV.

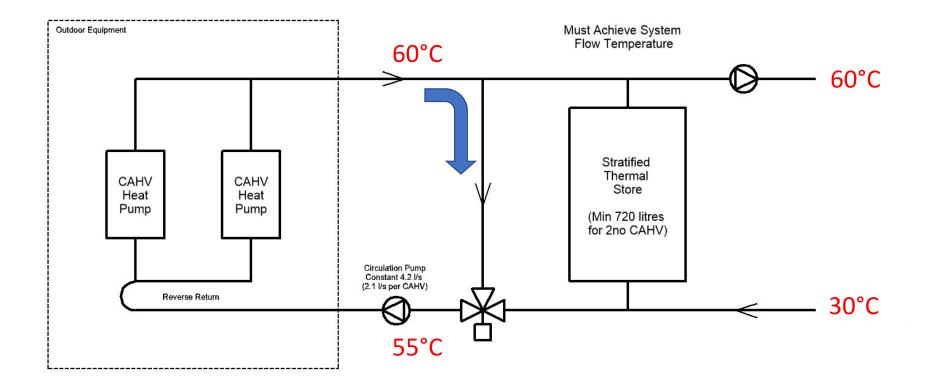

Heat pump buffer and COP

150 two bedroom apartments	60/30
DHW peak flow rate	2.2 l/s
Heating peak flow rate	1.6 l/s
Total peak flow rate	3.8 l/s

SAV₆

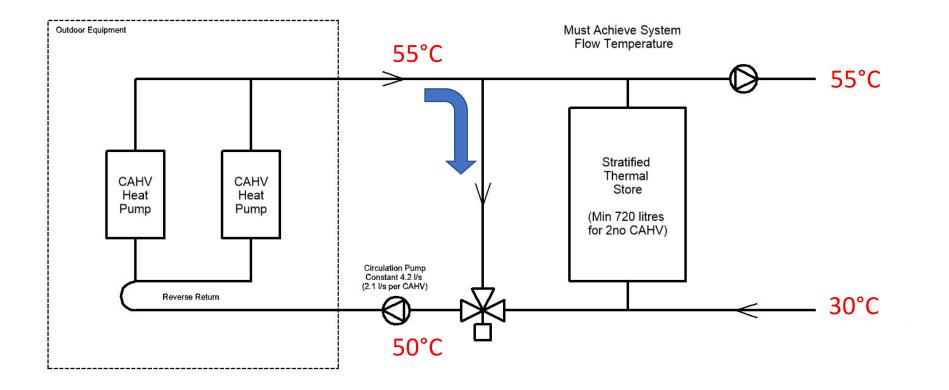

Heat pumps only design

- must achieve system flow temperature
- poor COP (heat pump operating 55/60°C)
- SCOP below 2.8

Outdoor temp.	СОР	HP operating temp.
5°C	2.29	55/60°C

Heat pumps only design

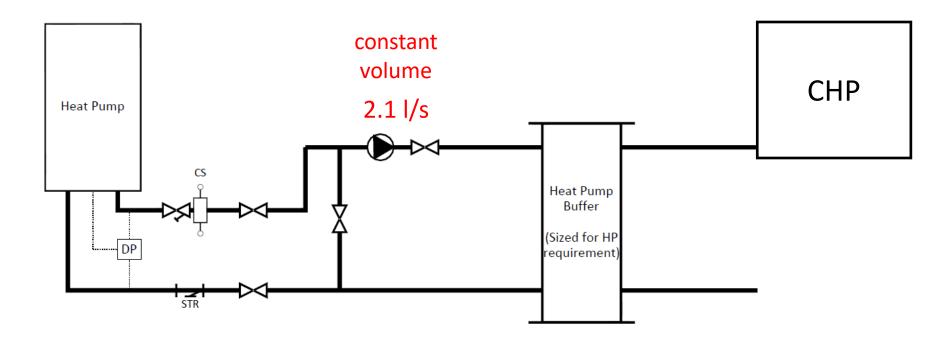

- must achieve system flow temperature
- poor COP (heat pump operating 50/55°C)
- SCOP below 2.8

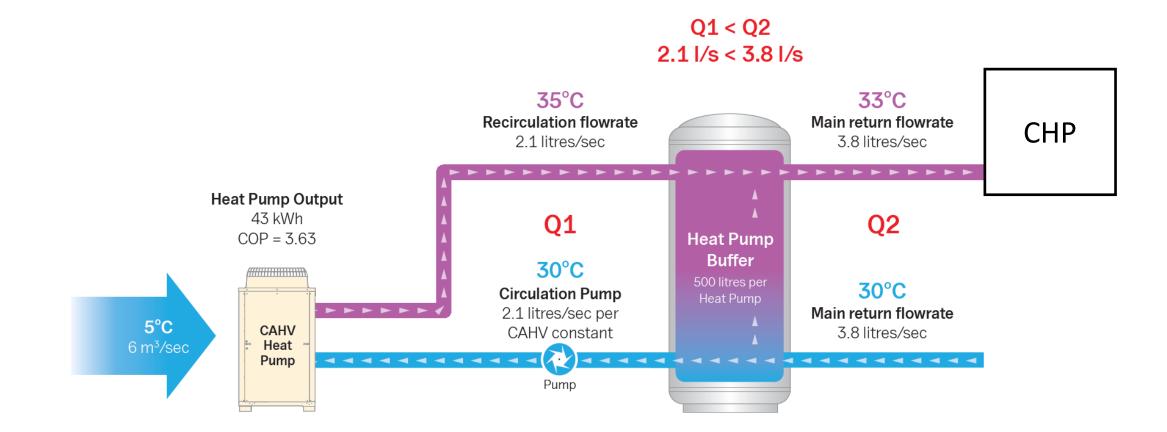

Outdoor temp.	СОР	HP operating temp.
5°C	2.49	50/55°C

Heat pump as preheat - buffer and COP SAV.

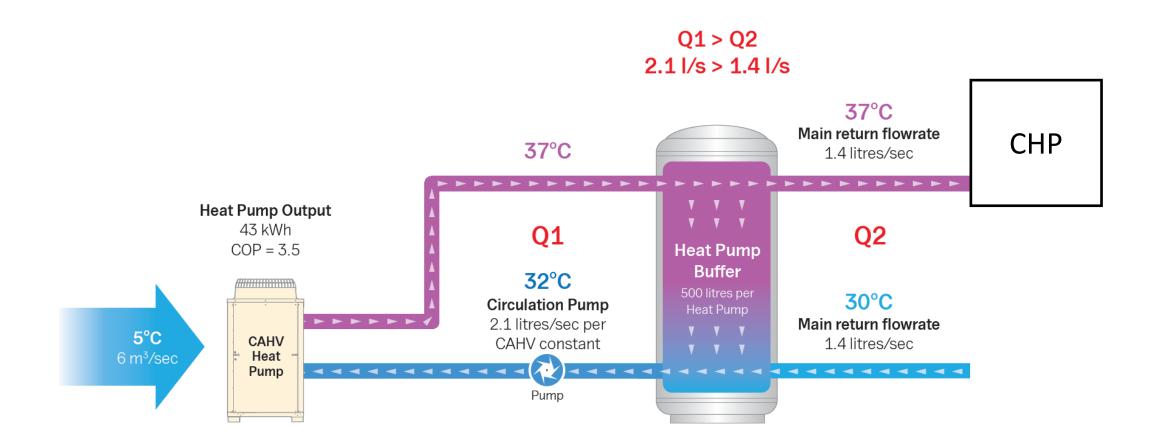

150 two bedroom apartments	60/30
DHW peak flow rate	2.2 l/s
Heating peak flow rate	1.6 l/s
Total peak flow rate	3.8 l/s

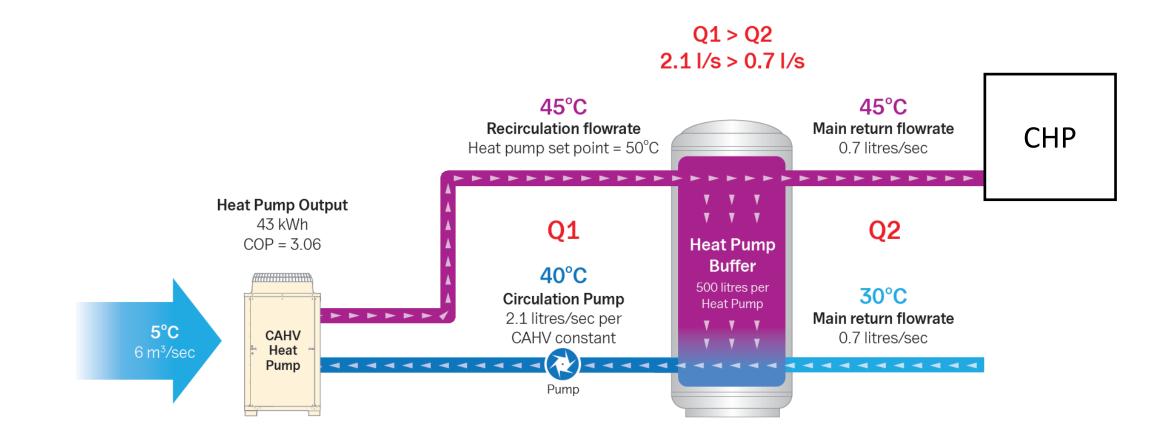

Heat pump as preheat - buffer and COP SAV.

Heat pump as preheat - buffer and COP SAV,

Heat pump as preheat - buffer and COP SAV,

Plant selection (150 flats) - cost SAV.

HP only plant room

Type of plant	Max. thermal output	Thermal store/buffer	Capital cost	Cost per flat
Heat pumps (CAHV)	6 x 43 kW	2,200 l	£22,700 each	
Total	258 kW	2,200 l	£136,000	£907

Hybrid plant room

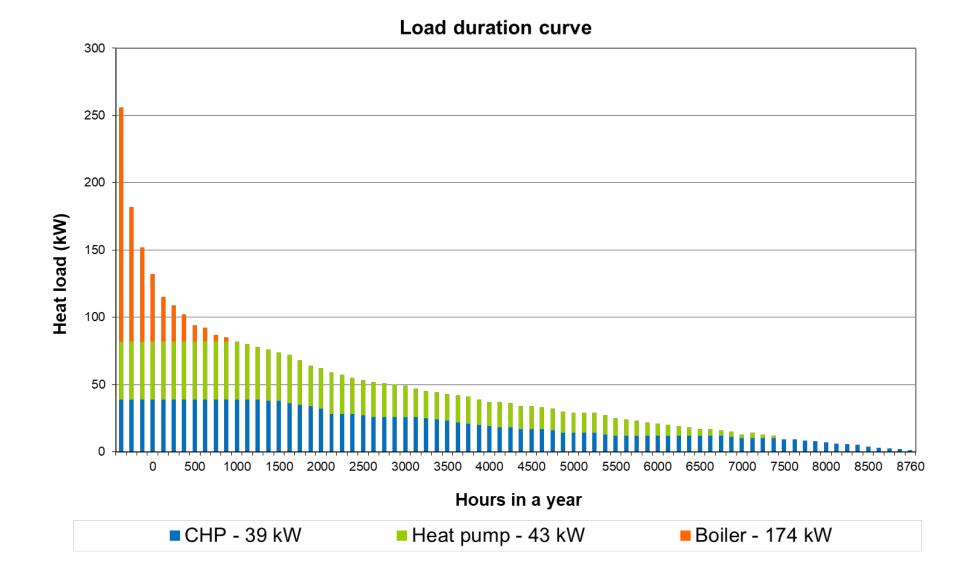

Type of plant	Max. thermal output	Thermal store/buffer	Capital cost	Cost per flat
CHP (XRGI 20)	39 kW	500 l	£42,000	
Heat pump (CAHV)	43 kW	500 l	£23,000	
Boiler (gas or electric)	174 kW	2,000 l	£16,000	
Total	256 kW	3,000 l	£81,000	£540

Design choices

	HP only	HP + CHP + boiler
CAPEX	£136,000	£81,000
OPEX	£42,000	£25,000
SCOP	2.5	3.2
Security of supply	×	V
Sector coupling	x	V
SAP 2012 / el. grid marginal

Heat Network – DHW

^{50°c} Return temperatures - 35kW DHW

Cold water temperature °C	10°	15°	20°	
Primary temperature °C	Return temperature °C	Return temperature °C	Return temperature °C	
60°C	19.97°C	23.25°C	26.7°C	

Return temperatures - 35kW DHW

Cold water temperature °C	10°	15°	20°	
Primary temperature °C	Return temperature °C	Return temperature °C	Return temperature °C	
60°C	16.64°C	20.12°C	23.9°C	

DHW Tapping Temperature – UK Clarification

HEATING, WATER HEATERS AND DATA CENTRES

his month: Water heater news; Rinnai updates on hydrogen appliances; Li-ion batteries in data centr

SPECIAL FEATURES

HSE clarifies risk guidance on instantaneous water heaters DHW energy efficiency consultation to take place this month

The requirement for ≥50°C delivery at outlets in M1 minute is applicable to systems incorporating hot-water storage, and does not necessarily apply for instantaneous water heaters. This means that the HSE has no fundamental objection to the reduction in temperature at outlets from HIUs.

- No Stored water (low risk)
- HIU = Combi boilers accepted temperatures
- Dish washing 45 sufficient

Response from Proctor & Gamble's R&D department:

"We test Fairy across a range of temperatures. However, 38-41 °C is in the normal temperature range that a consumer would use for this product."

DHW – Load Revision - UK

Table 10 - Typical sizes of DHW HIU plate heat exchangers

Property type/suitability	Design Maximum occupancy	Number of bathrooms	Typical maximum power @ 10°C feed and 55°C DHW supply temperatures
Studio/1-bed	1	1	25-30 kW
Large 1-bed/ Small 2-bed	3	1	30-35 kW
Medium 2-bed/3- bed	4	2	35 kW

CP 1 (2020)

Space Heating

Best practice – typically not more than 25 W/m²

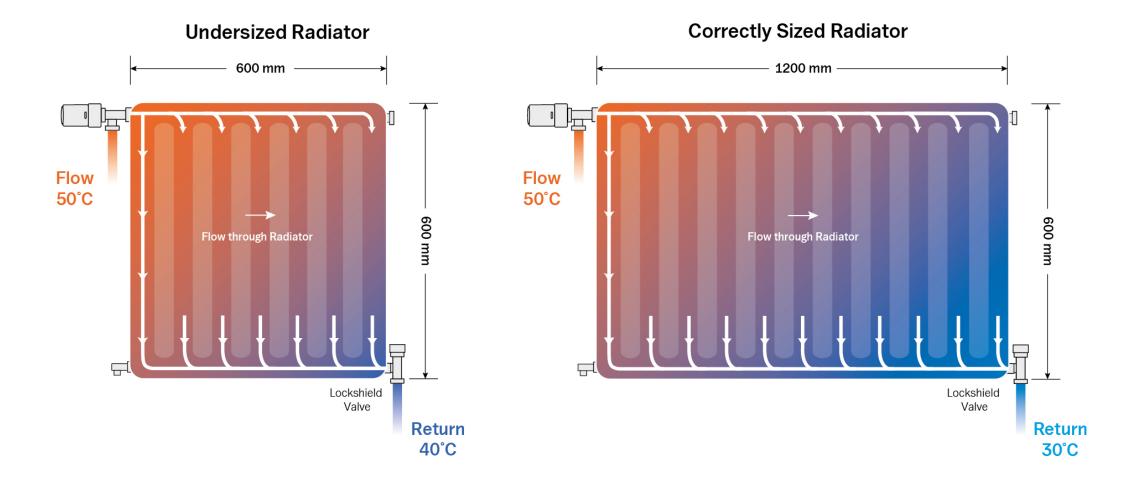

Space heating selection is critical for achieving low system return temperatures and efficient plant and distribution infrastructure sizing.

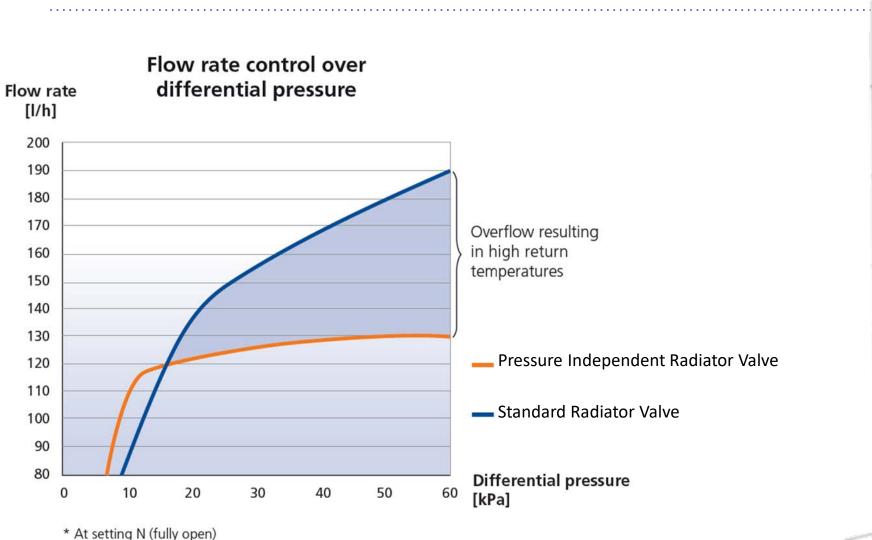

Heat Network return temper		
Heat Network return	Space heating flow	Space heating return
38.31°C	55°C	35°C
31.81°C	50°C	30°C

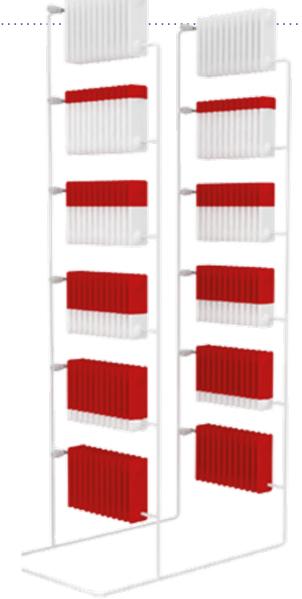

Selection of Heat Emitters

Pressure Independent Control Valve

Heat Network return temper		
Heat Network return	Space heating flow	Space heating return
35.08°C	40°C	35°C
30.05°C	35°C	30°C

• Avoid high thermal mass

• Avoid returns above 30°C

Screeded Floors						
	UFH System Output (W/m²)					
Flow/Return Temperatures & UFH Pipe Centres (mm)						
	65-55°C		60-50°C		55-45°C	
	200 mm	300 mm	200 mm	300mm	200 mm	300 mm

Minimising Heat Loss & Heat Gain

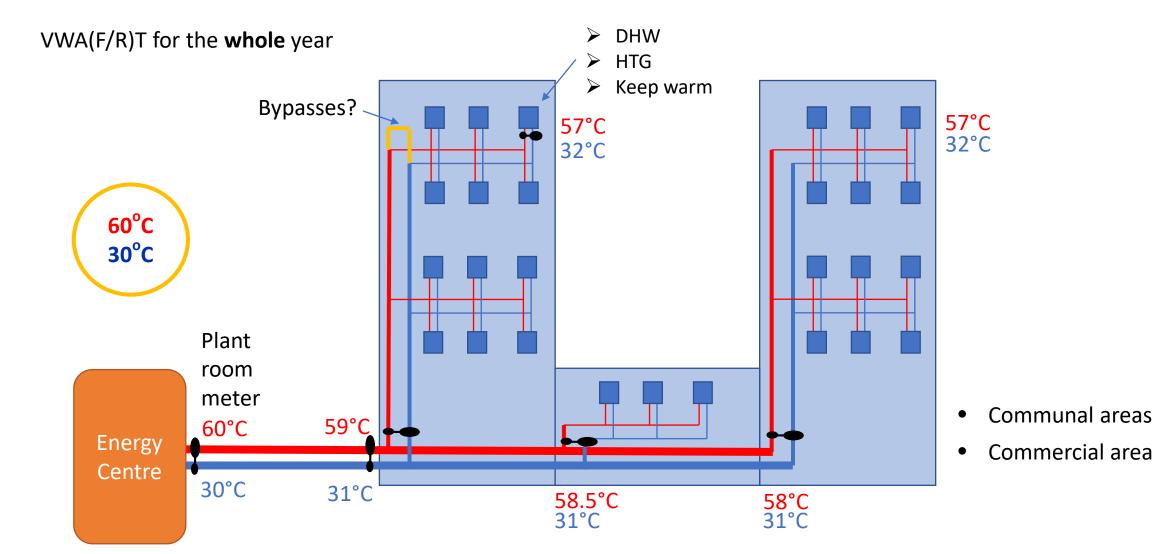

Primary side

• Reduce pipe size (possible with new guidelines)

• Insulate to avoid gains and losses

What Does 60/30 Scheme Look Like?

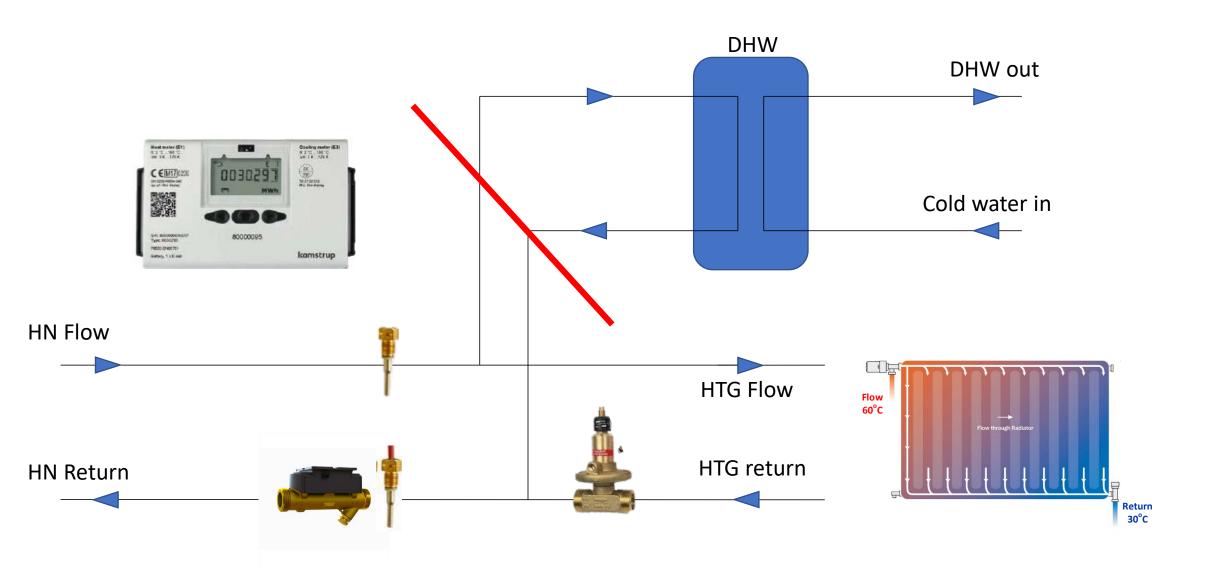

Ultrasonic Meter Commissioning

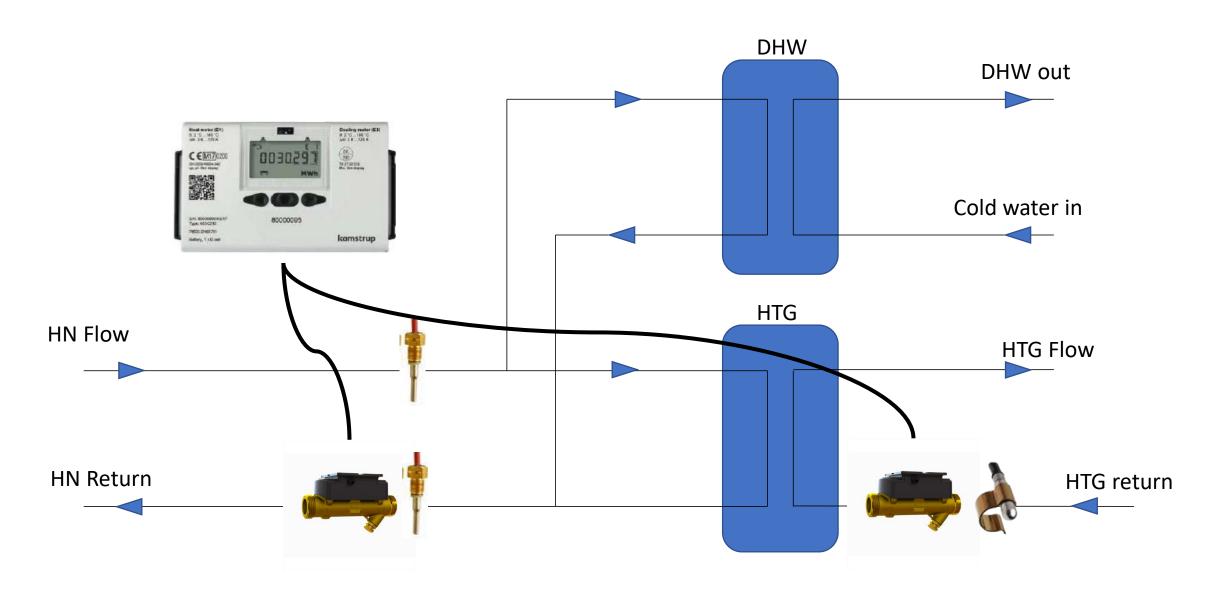

Commissioning on Direct Units

60/30 Commissioning Method with UMS

Commissioning Method with UMS

Each heat emitter

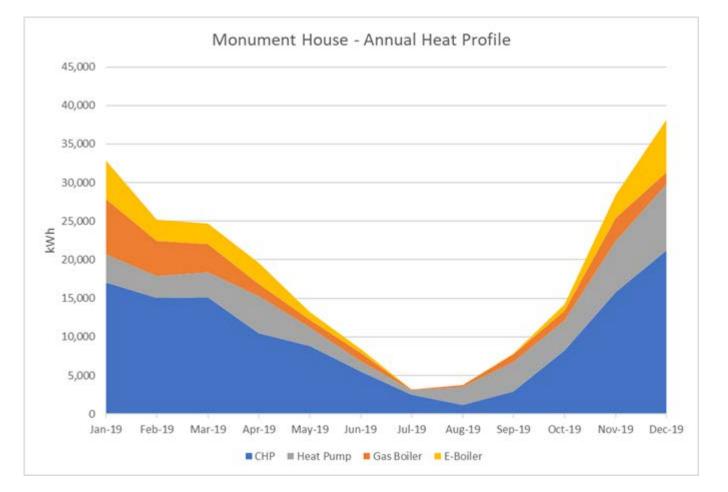

- Set the valve to the required setting
- The lock shield valve fully open
- Confirm the desired flow rate at the energy meter (adjust accordingly)
- Flow and return temps (may vary from design conditions)

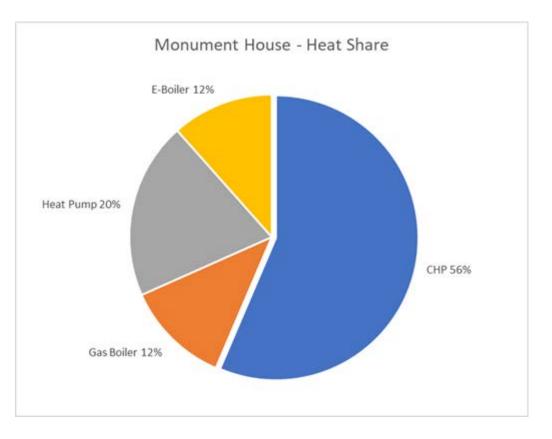

Full load

- Confirm full load flow rate
- Flow and return temps (may vary from design conditions)

SAV office and warehouse

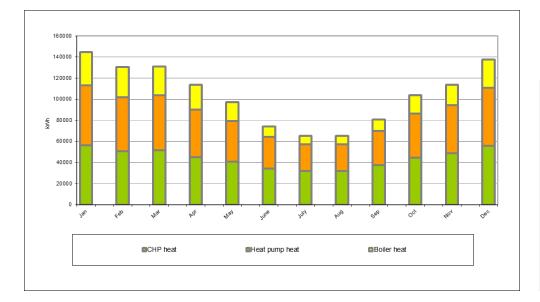

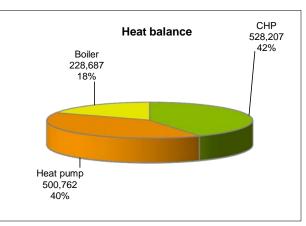

SAV.

The Hyde Hendon

- 387 apartments + commercial
- $2 \times 39 \text{ kW CHP} + 2 \times 43 \text{ kW HP} + \text{gas boilers}$

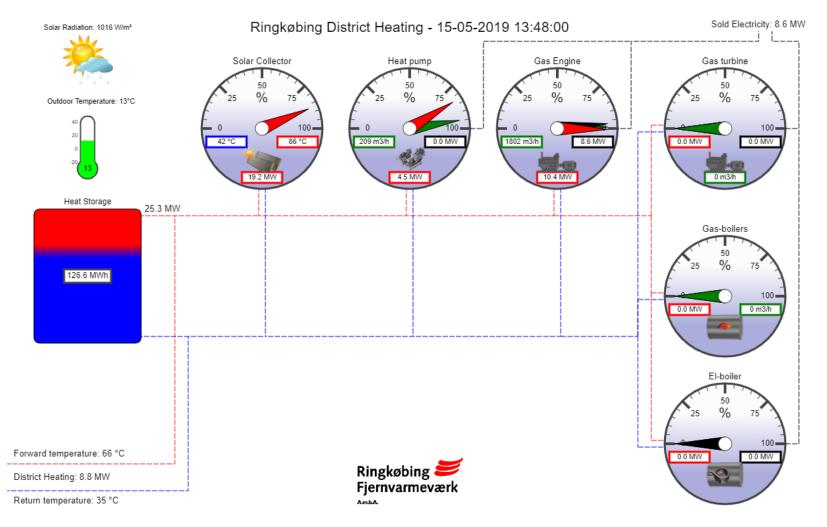

SAV.

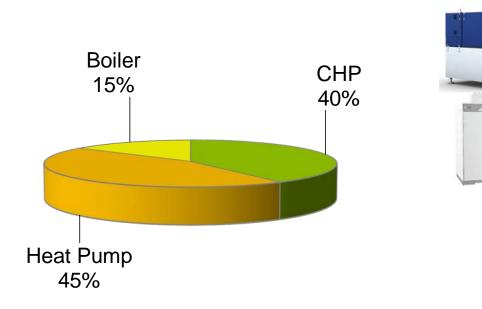

Ringkøbing District Heating

SAV_{\$}

Summary - integrating heat pumps

- low return temperature
- large delta T for efficient building
- COP/SCOP
- CO₂ reduction
- CAPEX
- OPEX
